

Profile Summary

AI Developer with strong Python expertise and hands-on experience in Generative AI, LLMs, and workflow automation. Skilled in building and deploying goal-oriented AI solutions using n8n, Make.com, Python, prompt engineering, and structured outputs, with solid experience in API integration, web scraping, and data handling for scalable systems. Eager to learn and apply new technologies in corporate environments, contributing effectively both in collaborative teams and independently.

Work Experience

Python Developer Intern | Techiacs Solution

june 2024 - dec 2024

- Web Scraping Project: Built a program using Python to scrape product names and prices from a website like Amazon. I got hands-on experience working with both BeautifulSoup for simple tasks and Scrapy for handling larger, more structured data collection.
- Coin Price Tracker Bot: Created a small bot that tracks cryptocurrency prices. It connects to the Binance API to get real-time price data for a specific coin, which helped me learn about working with external APIs and real-time data monitoring.
- Warehouse Inventory Tool: Developed a basic inventory system for a warehouse using Python. The system used JSON file handling to save and load all the product information and stock counts, giving me practical experience with persistent data storage and file I/O.

Web Developer Intern | HIST

feb 2024 - may 2024

- Building a complete, functional blog Website: giving me hands-on full-stack web development experience. I handled the backend using PHP and MySQL to manage post content via CRUD functionality, while designing the frontend structure with HTML and styling it using CSS and the Bootstrap framework. I also added dynamic features and interactivity by integrating JavaScript and AJAX.

Professional Skills

AI - ML

Google ADK | n8n | Make.com

Languages

Python | PHP | JavaScript | SQL | HTML/CSS

Databases

MYSQL | Oracle

Projects

Auto Part Assistant (AI-Powered Parts Inquiry & Ordering System) | N8n | Eleven labs | Twillio

- Integrated an AutoPart Search API to retrieve vehicle-specific spare part data using make, model, year, and engine details. Utilized AI agents, LLM prompt engineering, and structured JSON outputs for reliable part identification. Designed and orchestrated automation workflows in n8n to manage data flow, business logic, API calls, and conditional decision-making, connected to ERP/CRM simulations (Google Sheets), with REST API integrations, validation rules, and robust error handling for accurate pricing, availability checks, and order processing.

Email Generating Agent:

- Created a AI Agent that automatically drafts emails (subject, body, tone) based on simple user requests. This project used Google's Gemini 2.0 Flash model and the Agent Development Kit (ADK), implementing a structured output schema (JSON) to control the AI's response,

Whatsapp ChatBot

- Built a WhatsApp chatbot using UltraMsg API and n8n to automate messaging workflows and handle user interactions efficiently.

Education

B.S Software Engineering

University of Sindh Jamshoro

2020-2024

Bachelors in Commerce (B.COM)

University of Sindh Jamshoro

2018-2020
